Abstract:
A simple, precise, rapid, and accurate reversed–phase high performance liquid chromatographic method has been developed for the determination of ascorbic acid in pure from, pharmaceutical formulations, biological samples and in environmental water samples.

Chromatography was carried out on supercar L1 (C18) reversed-phase column (25cm×4.6mm), 5 microns, using a mixture of methanol : water (42: 58v/v) as a mobile phase at a flow rate of 1.0 ml.min⁻¹. Detection was performed at 254nm at ambient temperature.

The retention time for ascorbic acid was found 2.3 minutes. The calibration curve was linear (r= 0.9998) over a concentration range from 0.5 to 12.5µg/ml. Limit of detection (LOD) and limit of quantitation (LOQ) were found 3ng/ml and 9 ng/ml respectively. The method was validated for its linearity, precision and accuracy.

The proposed method was successfully applied for the determination of ascorbic acid in pure form, pharmaceutical formulations, and biological samples and in environmental water samples.

Keyword: HPLC, Ascorbic acid, Pharmaceutical formulations.

Introduction:
Ascorbic acid, the enolic form of 3-oxo-L-gulofuranolactone [1] (figure-1), a water-soluble more commonly known as vitamin C which is an important vitamin having a chemical structure that justifies its classification as a carbohydrate, and is important in forming collagen, a protein that gives structure to bones, muscles and blood vessels.
The deficiency of this vitamin leads to many diseases: scurvy, plug poisoning, liver disease, allergic reactions, arteriosclerosis, etc. So that is widely used in the treatment of certain diseases such as scurvy, common cold, anemia, hemorrhagic disorders, wound healing as well as infertility[1-4].

It is one of the most ubiquitous vitamins ever discovered. In addition, ascorbic acid has been widely used in the pharmaceutical, chemical, cosmetic and food industry as antioxidant. Therefore, there is a need to find an accurate, reliable, rapid, and easy method for measuring the amount of ascorbic acid in a sample. However, various methods have been employed for the quantitative determination of ascorbic acid in pharmaceutical formulations, fruit juices, urine, plasma etc.

These include titration[5-10], fluorimetry[11], spectrophotometry[12-17], differential pulse voltammetry[18-19], square-wave voltammetry[20-21], cyclic voltammetry[22], capillary zone electrophoresis[23], chemiluminescence[24] and high-performance liquid chromatography (HPLC)[25-28].

High performance liquid chromatography (HPLC) can be used for determination of drugs and for purposes of control throughout the entire manufacturing process of drugs as well as quality control of the finished product.

It has the advantages of being sensitive, selective, rapid, accurate and reproducible.

The main objective of the present study was to optimize a simple and rapid HPLC method for the determination of ascorbic acid in pharmaceutical preparations, biological samples and in environmental water samples.

**Materials and Methods:**

**Experimental Apparatus:**

Chromatographic system consisted of a shimadzu HPLC model LC-20AT with UV detector model SPD-20A and L_{1} supelco column (25cm×4.6mm), 5 µm particle size. HPLC conditions are given in table-1.

**Reagents:-**

All chemical used were of analytical or pharmaceutical grade and HPLC grade methanol from Merck (Darmstadt, Germany) was used throughout.

Ascorbic acid standard material was provided from the state company for pharmaceutical industries (HPI) Mosul-Iraq.

**Preparation of standard solutions:**

A standard stock solution of ascorbic acid (100µg/ml) was prepared in mobile phase. Working standard solutions in a range of (0.5-12.5µg/ml) were prepared by dilution from stock solution.

**Preparation of mobile phase:-**

The mobile phase was prepared by mixing methanol, water, in the ratio of 42: 58v/v.

**HPLC method for determining ascorbic acid:**

A series of standard solution containing 0.5-12.5µg/ml of ascorbic acid and the sample solution of pharmaceutical preparation were applied respectively. 10µl
an aliquot of each solution was injected on to the column in a duplicate and the chromatograms were recorded. Calibration graph was constructed by plotting the mean peak area versus concentration of ascorbic acid. The concentration of the unknown was read from the calibration graph or calculated from the regression equation derived from the concentration and peak area data.

**Procedures for pharmaceutical preparations (syrups):**
Two different marketed ascorbic acid syrup formulations (Coldin 50mg/5ml, Pulmocodin 12.5mg/5ml, were selected for analysis). The content of 5 bottles was mixed well in 1L dried beaker. Aliquots equivalent to 10 mg of ascorbic acid were transferred into 1L volumetric flasks and diluted with mobile phase to the volume. And the amount of ascorbic acid was determined by comparing the peak area of the assay preparation with the standard preparation at the same concentration.

**Procedure for pharmaceutical preparations (tablets):**
Two different marketed ascorbic acid tablets formulations (Flu-out 100mg, ascorbic acid tablet 250mg), were selected for analysis. To minimize a possible variation in the composition of the tablet, the mixed content of 20 tablets were weighed and grounded, then the powder equivalent to 5 mg of ascorbic acid in to 500 ml volumetric flask. Added about 100 ml mobile phase and mixed well for 30 minute to dissolve, completed to the volume with mobile phase. Filtered and then determination of ascorbic acid as described under recommended procedure.

**Procedure for biological samples:**
Since the presence of ascorbic acid has been reported in blood and urine samples\[29\]. The method was applied for its determination in these samples. 5mL of blood and urine samples were taken from patholgy laboratory [Nineveh-Iraq] and 1 mL of 5% EDTA, 2 mL of 1% (tri chloro acetic acid) and 2mL of 3% meta phosphoric acid were added to the analyte, centrifuged, the supernatant was diluted to a suitable volume with mobile phase, and the amount of ascorbic acid was determined by calculated from the regression equation derived from the concentration and peak area data.

**Procedure for water samples:**
The tap and river water samples were found to be free from ascorbic acid, synthetic samples were prepared by adding known concentration of ascorbic acid to each sample prior analysis in the range from 1-10 ppm the determination of ascorbic acid proceeded as described under HPLC method for determining ascorbic acid. Calculate the percentage recovery using a calibration graph previously prepared.

**Results and Discussion:**
The development of HPLC methods for the determination of drugs has received considerable attention in recent years because of their importance in the quality control of drugs and pharmaceutical products.

The aim of this study was to develop a rapid HPLC method for the determination of ascorbic acid in pure from, its pharmaceutical formulations, and biological samples and in environmental water samples, using the most commonly employed RP C\textsubscript{18} column with UV detection. The detection wavelength of 254nm was chosen in order to achieve a good sensitivity for quantitative determination of ascorbic acid in syrups, tablets, blood, urine and water.

The mobile phase consisting of methanol: water (42:58) offered a good separation at ambient temperature under these conditions using a flow rate of 1.0 ml/min and retention time of 2.3 min as shown in the chromatogram, figure-2.
Under the described experimental conditions the analyte peaks were well defined and free from tailing. Ascorbic acid was determined by measuring the peak area. A plot of peak area against concentration gave a linear relationship \((r=0.999)\) over the concentration range 0.5-12.5µg/ml.

Using regression analysis, the linear equation \(Y=50341x+75148\) was obtained where \(Y\) is the mean peak area and \(X\) is the concentration in µg/ml figure-3.

Limit of detection (LOD) and limit of quantification (LOQ) were found 3ng/ml and 9ng/ml respectively.

**Method precision:**

The precision of the method was established by carrying out the analysis of ascorbic acid \((n=6)\) using the proposed method. The low value of standard deviation showed that the method was precise. The results obtained were presented in table-2.

<table>
<thead>

Analytical application:
The proposed method was successfully applied to the assay of ascorbic acid in syrups, tablets, and blood, urine and water samples. The result of analysis for pharmaceutical formulations shown in table-4, which reveals that there is close agreement between the results obtained by the proposed method and label claim, the results of biological samples (blood and urine table-5) and the results of water samples (table-6) show that the recovery values obtained were closed to 100%.

Conclusion:
In this study, a simple, rapid, sensitive, accurate, precise and economical HPLC method was developed and validated for the determination of ascorbic acid in syrups, tablets, blood, urine and water samples. The method was selective using C\textsubscript{18} (L1) analytical column and applicable to different samples.
Thus the developed method is recommended for control throughout the entire manufacturing process of drugs as well as quality control of the finished product in industry, research laboratories and hospitals, in view of its high recovery and precision.
